#### 1.1 Symmetric Monoidal Categories

**Definition 1.** A monoidal category is a category, M, with the following data:

- An object  $\top$  of  $\mathcal{M}$ ,
- A bi-functor  $\otimes$  :  $\mathcal{M} \times \mathcal{M} \longrightarrow \mathcal{M}$ ,
- The following natural isomorphisms:

$$\begin{array}{l} \lambda_A: \top \otimes A \longrightarrow A \\ \rho_A: A \otimes \top \longrightarrow A \\ \alpha_{A,B,C}: (A \otimes B) \otimes C \longrightarrow A \otimes (B \otimes C) \end{array}$$

• Subject to the following coherence diagrams:

**Definition 2.** A symmetric monoidal category (SMC) is a category, M, with the following data:

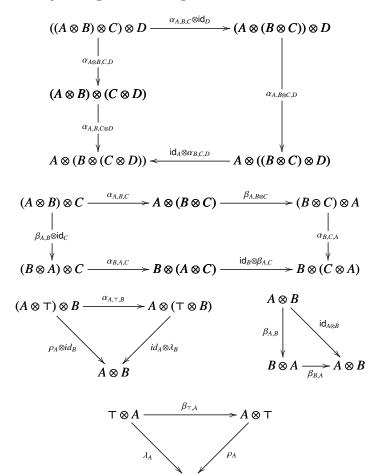

- An object  $\top$  of  $\mathcal{M}$ ,
- A bi-functor  $\otimes$  :  $\mathcal{M} \times \mathcal{M} \longrightarrow \mathcal{M}$ ,
- The following natural isomorphisms:

$$\begin{array}{l} \lambda_A: \top \otimes A \longrightarrow A \\ \rho_A: A \otimes \top \longrightarrow A \\ \alpha_{A,B,C}: (A \otimes B) \otimes C \longrightarrow A \otimes (B \otimes C) \end{array}$$

• A symmetry natural transformation:

$$\beta_{A,B}: A \otimes B \longrightarrow B \otimes A$$

• Subject to the following coherence diagrams:

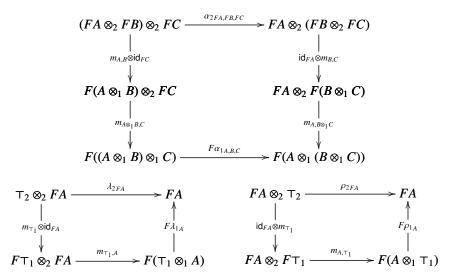

**Definition 3.** A symmetric monoidal closed category (SMCC) is a symmetric monoidal category,  $(\mathcal{M}, \top, \otimes)$ , such that, for any object B of M, the functor  $-\otimes B : \mathcal{M} \longrightarrow \mathcal{M}$  has a specified right adjoint. Hence, for any objects A and C of M there is an object  $B \multimap C$  of M and a natural bijection:

$$\operatorname{\mathsf{Hom}}_{\mathcal{M}}(A \otimes B, C) \cong \operatorname{\mathsf{Hom}}_{\mathcal{M}}(A, B \multimap C)$$

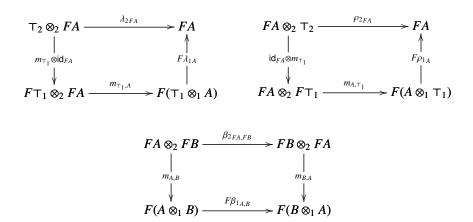

We call the functor  $\multimap: \mathcal{M} \times \mathcal{M} \longrightarrow \mathcal{M}$  the internal hom of  $\mathcal{M}$ .

**Definition 4.** Suppose we are given two monoidal categories  $(\mathcal{M}_1, \top_1, \otimes_1, \alpha_1, \lambda_1, \rho_1, \beta_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2, \alpha_2, \lambda_2, \rho_2, \beta_2)$ . Then a **monoidal functor** is a functor  $F: \mathcal{M}_1 \longrightarrow \mathcal{M}_2$ , a map  $m_{\top_1}: \top_2 \longrightarrow F \top_1$  and a natural transformation  $m_{A,B}: FA \otimes_2 FB \longrightarrow F(A \otimes_1 B)$  subject to the following coherence conditions:

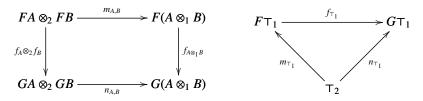

Need to notice that the composition of monoidal functors is also monoidal, subject to the above coherence conditions.

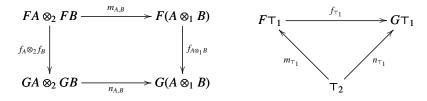

**Definition 5.** Suppose we are given two symmetric monoidal closed categories  $(\mathcal{M}_1, \top_1, \otimes_1, \alpha_1, \lambda_1, \rho_1, \beta_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2, \alpha_2, \lambda_2, \rho_2, \beta_2)$ . Then a **symmetric monoidal** functor is a functor  $F: \mathcal{M}_1 \longrightarrow \mathcal{M}_2$ , a map  $m_{\top_1}: \top_2 \longrightarrow F \top_1$  and a natural transformation  $m_{A,B}: FA \otimes_2 FB \longrightarrow F(A \otimes_1 B)$  subject to the following coherence conditions:

**Definition 6.** Suppose  $(\mathcal{M}_1, \top_1, \otimes_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2)$  are monoidal categories, and (F, m) and (G, n) are monoidal functors between  $\mathcal{M}_1$  and  $\mathcal{M}_2$ . Then a **monoidal natural transformation** is a natural transformation,  $f: F \longrightarrow G$ , subject to the following coherence diagrams:

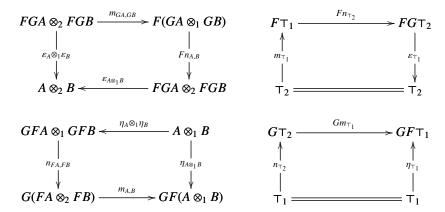

**Definition 7.** Suppose  $(\mathcal{M}_1, \top_1, \otimes_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2)$  are SMCs, and (F, m) and (G, n) are symmetric monoidal functors between  $\mathcal{M}_1$  and  $\mathcal{M}_2$ . Then a **symmetric monoidal** natural transformation is a natural transformation,  $f: F \longrightarrow G$ , subject to the following coherence diagrams:

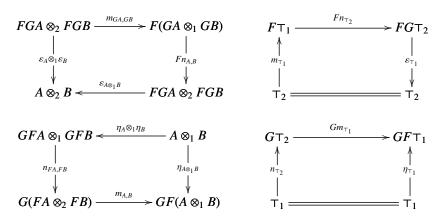

**Definition 8.** Suppose  $(\mathcal{M}_1, \top_1, \otimes_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2)$  are monoidal categories, and (F, m) is a monoidal functor between  $\mathcal{M}_1$  and  $\mathcal{M}_2$  and (G, n) is a monoidal functor between  $\mathcal{M}_2$  and  $\mathcal{M}_1$ . Then a **monoidal adjunction** is an ordinary adjunction  $\mathcal{M}_1$ :  $F \dashv G : \mathcal{M}_2$  such that the unit,  $\eta_A : A \to GFA$ , and the counit,  $\varepsilon_A : FGA \to A$ , are

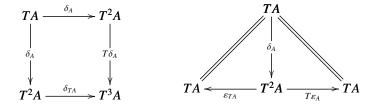

monoidal natural transformations. Thus, the following diagrams must commute:

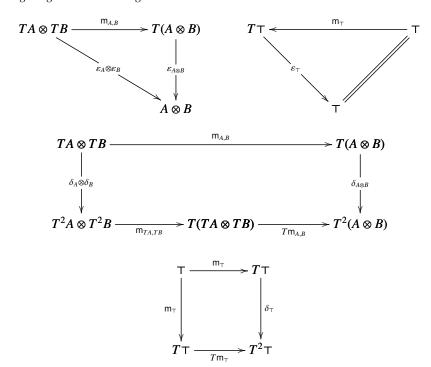

**Definition 9.** Suppose  $(\mathcal{M}_1, \top_1, \otimes_1)$  and  $(\mathcal{M}_2, \top_2, \otimes_2)$  are SMCs, and (F, m) is a symmetric monoidal functor between  $\mathcal{M}_1$  and  $\mathcal{M}_2$  and (G, n) is a symmetric monoidal functor between  $\mathcal{M}_2$  and  $\mathcal{M}_1$ . Then a **symmetric monoidal adjunction** is an ordinary adjunction  $\mathcal{M}_1: F \dashv G: \mathcal{M}_2$  such that the unit,  $\eta_A: A \to GFA$ , and the counit,  $\varepsilon_A: FGA \to A$ , are symmetric monoidal natural transformations. Thus, the following diagrams must commute:

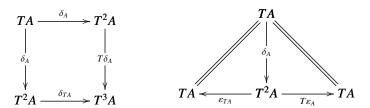

**Definition 10.** A monoidal comonad on a monoidal category C is a triple  $(T, \varepsilon, \delta)$ , where  $(T, \mathsf{m})$  is a monoidal endofunctor on C,  $\varepsilon_A : TA \longrightarrow A$  and  $\delta_A : TA \to T^2A$  are monoidal natural transformations, which make the following diagrams commute:

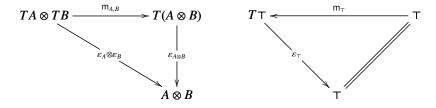

The assumption that  $\varepsilon$  and  $\delta$  are monoidal natural transformations amount to the following diagrams commuting:

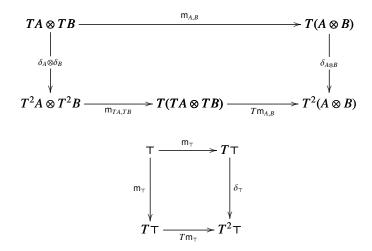

**Definition 11.** A symmetric monoidal comonad on a symmetric monoidal category C is a triple  $(T, \varepsilon, \delta)$ , where (T, m) is a symmetric monoidal endofunctor on C,  $\varepsilon_A$ :  $TA \longrightarrow A$  and  $\delta_A : TA \to T^2A$  are symmetric monoidal natural transformations, which make the following diagrams commute:

The assumption that  $\varepsilon$  and  $\delta$  are symmetric monoidal natural transformations amount to the following diagrams commuting:

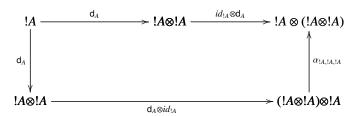

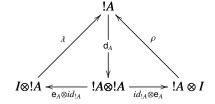

#### 1.2 Linear Category

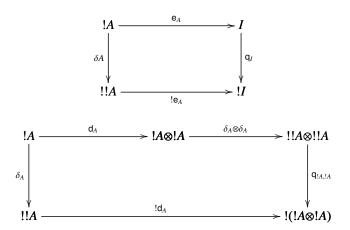

**Definition 12.** A linear category,  $(\mathcal{L}, !, e, d)$ , is specified by

- a symmetric monoidal closed category  $(\mathcal{L}, I, \otimes, \multimap)$ ,
- a symmetric monoidal comonad  $(!, \varepsilon, \delta)$  on  $\mathcal{L}$ , with  $q_{A,B} : !A \otimes !B \longrightarrow !(A \otimes B)$  and  $q_I : I \longrightarrow !I$ ;
- monoidal natural transformations on  $\mathcal{L}$  with components  $e_A : !A \longrightarrow I$  and  $d_A : !A \longrightarrow !A \otimes !A$ , s.t.
  - each (!A,  $e_A$ ,  $d_A$ ) is a commutative comonoid, i.e. the following diagrams commute and  $\beta \circ d_A = d_A$  where  $\beta_{B,C} : B \otimes C \longrightarrow C \otimes B$  is the symmetry natural transformation of  $\mathcal{L}$ ;

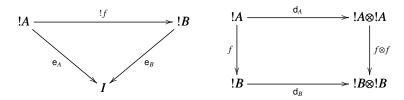

Let's change e and d to something else, since we will be using e for the exchange modality. -  $e_A$  and  $d_A$  are coalgebra morphisms, i.e. the following diagrams commute;

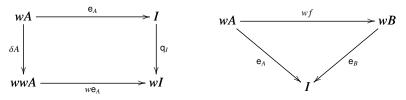

- any coalgebra morphism  $f:(!A,\delta_A) \longrightarrow (!B,\delta_B)$  between free coalgebras preserve the comonoid structure given by  $\Theta$  and G, i.e. the following diagrams commute.

**Definition 13.** A linear category with weakening,  $(\mathcal{L}, w, e)$ , is specified by

- a monoidal category  $(\mathcal{L}, I, \otimes)$ ,
- a monoidal comonad  $(w, \varepsilon, \delta)$  on  $\mathcal{L}$  with  $q_{A,B} : wA \otimes wB \longrightarrow w(A \otimes B)$  and  $q_I : I \longrightarrow wI$ , and
- a monoidal natural transformation e on  $\mathcal{L}$  with components  $e_A: wA \longrightarrow I$  s.t. the following diagrams commute:

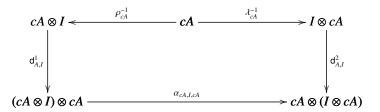

**Definition 14.** A linear category with contraction,  $(\mathcal{L}, c, d^1, d^2)$ , is specified by

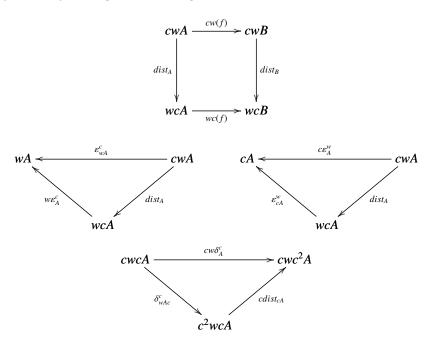

Instead of d<sup>i</sup> what do you think of contraL and contraR?

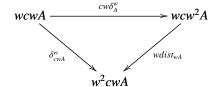

• a monoidal category  $(\mathcal{L}, I, \otimes)$ ,

- a monoidal comonad  $(c, \varepsilon, \delta)$  on  $\mathcal{L}$  with  $q_{A,B}: cA \otimes cB \longrightarrow c(A \otimes B)$  and  $q_I: I \longrightarrow cI$ , and
- monoidal natural transformations  $d^1$  and  $d^2$  on  $\mathcal{L}$  with components  $d^1_{A,B}: cA \otimes B \longrightarrow (cA \otimes B) \otimes cA$  and  $d^2_{A,B}: B \otimes cA \longrightarrow cA \otimes (B \otimes cA)$ , s.t. the following diagram commutes:

**Definition 15.** Given two comonads  $(c, \varepsilon^c, \delta^c)$  and  $(w, \varepsilon^w, \delta^w)$  on a category  $\mathcal{L}$ , a distributive law of c over w is a natural transformation with components dist<sub>A</sub>:  $cwA \longrightarrow wcA$ , subject to the following coherence diagrams:

I am willing to bet that we will also need a coherence diagram involving should show up in the proof of the comonad laws. JJ: Two diagrams for added.

**Lemma 16.** Let  $(c, \varepsilon^c, \delta^c)$  and  $(w, \varepsilon^w, \delta^w)$  be two monoidal comonads on a linear category with weakening and contraction  $(\mathcal{L}, I, \otimes, w, e^w, c, d^{c1}, d^{c2})$ . Then the composition of c and w using the distributive law  $dist_A : cwA \longrightarrow wcA$  is a monoidal comonad  $(cw, \varepsilon, \delta)$  on  $\mathcal{L}$ .

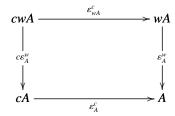

*Proof.* Suppose  $(c, \varepsilon^c, \delta^c)$  and

 $(w, \varepsilon^w, \delta^w)$  are monoidal comonads, and  $(\mathcal{L}, I, \otimes, w, e^w, c, d^{c1}, d^{c2})$  is a linear category with weakening and contraction. Since by definition  $w, c: \mathcal{L} \longrightarrow \mathcal{L}$  are monoidal functors we know that their composition  $wc: \mathcal{L} \longrightarrow \mathcal{L}$  is a monoidal functor:

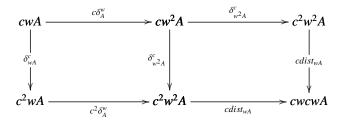

$$\mathsf{q}_{A,B}: cwA \otimes cwB \longrightarrow cw(A \otimes B)$$
 is defined as:  $\mathsf{q}_{A,B} = c\mathsf{q}_{A,B}^w \circ \mathsf{q}_{wA,wB}^c$ , and  $\mathsf{q}_I: I \longrightarrow cwI$  is defined as:  $\mathsf{q}_I = c\mathsf{q}_I^w \circ \mathsf{q}_I^c$ 

We must now define both  $\varepsilon_A : cwA \longrightarrow A$  and  $\delta_A : cwA \longrightarrow cwcwA$ , and then show that they are monoidal natural transformations subject to the comonad laws. Since we are composing two comonads each of  $\varepsilon$  and  $\delta$  can be given two definitions, but they are equivalent:

•  $\varepsilon_A$ :  $cwA \longrightarrow A$  is defined as in the diagram below, which commutes by the naturality of  $\varepsilon^c$ .

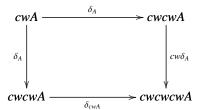

•  $\delta_A : cwA \longrightarrow cwcwA$  is defined as in the diagram:

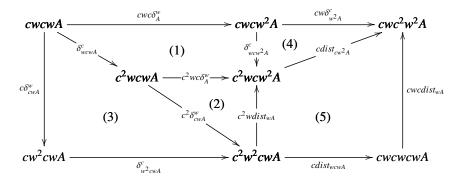

The left part of the diagram commutes by the naturality of  $\delta^c$  and the right part commutes trivially.

The remainder of the proof shows that the comonad laws hold.

• We show the comonad law  $cw\delta_A \circ \delta_A = \delta_{cwA} \circ \delta_A$ , expressed in the diagram below,

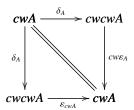

is satisfied by proving  $cw\delta_A = \delta_{cwA}$ , as in the following diagram chasing. (1) and (3) commutes by the naturality of  $\delta^c$ . (2), (4) and (5) commute by the conditions of *dist*.

I am not sure how the previous diagram follows from this diagram? Notice that it is not part of this in anyway. The way this should be proven is to simply expand the first diagram, and then fill it in with diagrams. JJ: Some explanations are added.

• The comonad law  $cw\varepsilon_A \circ \delta_A = \varepsilon_{cwA} \circ \delta_A = id_{cwA}$ , expressed in the diagram below,

is satisfied by the following two diagram chasings below.

The left triangle is expanded in the following diagram chasing. (1) commutes by the comonad law for w with components  $\delta^w_A$  and  $\varepsilon^w_{wA}$ . (2) commutes by the comonad law for c with components  $\delta^c_{w^2A}$  and  $\varepsilon^c_{w^2A}$ . (3), (4), (5) and (6) commute

by the definition of dist.

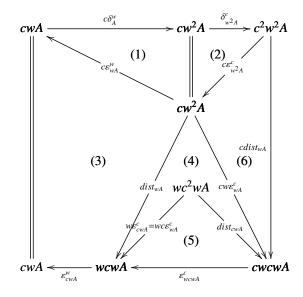

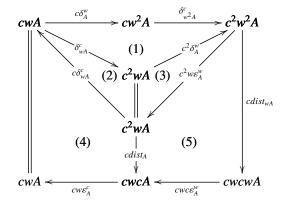

Diagram 4 is not a diagram notice there is no parallel paths, and diagram 3 commutes by a the one from Jone's. Diagrams 4, 5, and 6 do not commute, and hence need to be fixed. In fact, the arrow  $cw\varepsilon_{wA}^c$  is incorrectly applied, this does not typecheck! Any diagram that if commutes \*defines\* dist will not commute. Also, make this diagram wider so that labels on arrows are not intersecting with other arrows.

The right triangle is expanded in the following diagram chasing. (1) commutes by the naturality of  $\delta^c$ . (2) is the comonad law for c with components  $\delta^c_{wA}$  and  $\varepsilon^c_{wA}$ . (3) is the comonad law for w with components  $\delta^w_A$  and  $\varepsilon^w_A$ . (3) and (4) commute by the definition of dist.

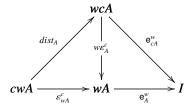

**Lemma 17.** Let  $(c, \varepsilon^c, \delta^c)$  and  $(w, \varepsilon^w, \delta^w)$  be two monoidal comonads on a linear category with weakening and contraction  $(\mathcal{L}, I, \otimes, w, e^w, c, d^{c1}, d^{c2})$ , and  $(cw, \varepsilon, \delta)$  be the monoidal comonad on  $\mathcal{L}$  by composing c and w using the distributive law dist<sub>A</sub>:  $cwA \longrightarrow wcA$ . The monoidal natural transformations e and d with components  $e_A$ :  $cwA \longrightarrow I$  and  $d_A$ :  $cwA \longrightarrow cwA \otimes cwA$  satisfy the following conditions:

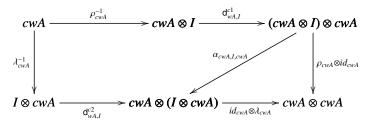

- Each (cwA,  $e_A$ , d) is a commutative comonoid.
- $e_A$  and  $d_A$  are coalgebra morphisms.
- Any coalgebra morphism  $f:(cwA, \delta_A) \longrightarrow (cwB, \delta_B)$  between (free?) coalgebras preserve the comonoid structure given by e and d.

*Proof.* We first define  $e_A : cwA \longrightarrow I$  and  $d_A : cwA \longrightarrow cwA \otimes cwA$ . Each of them can also be given two equivalent definitions:

•  $e_A : cwA \longrightarrow I$  is defined as in the diagram below. The left triangle commutes by the definition of *dist* and the right triangle commutes by the definition of  $e^w$ .

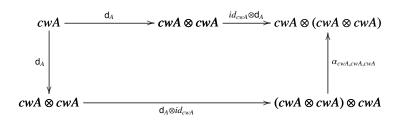

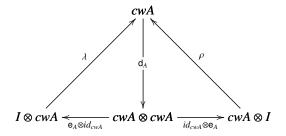

•  $d_A : cwA \longrightarrow cwA \otimes cwA$  is defined as below. The left part of the diagram commutes by the definitions of  $d^{c1}$  and of  $d^{c2}$ , and the right part commutes because  $\mathcal{L}$  is monoidal.

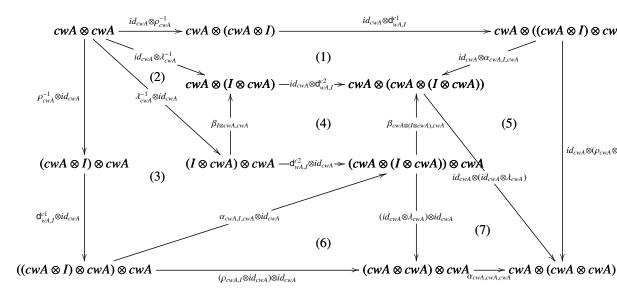

Then we show each condition is satisfied.

Each (cwA, e<sub>A</sub>, d<sub>A</sub>) is a commutative comonoid, i.e. the following diagrams commute:

We show that the first diagram above commutes by the following diagram chasing. (1) and (3) commute because  $(\mathcal{L}, c, \mathsf{d}^{c1}, \mathsf{d}^{c2})$  is a linear category with contranction. (2), (4), and (7) commute by the naturality of  $\beta$ . (5) and (6) commute by the coherence conditions of monoidal category.

• e and d are coalgebra morphisms, i.e. the following diagrams commute:

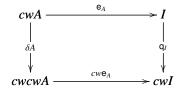

Diagram 1: Coalgebra Morphism 1

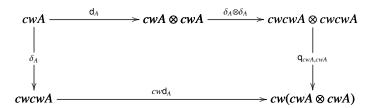

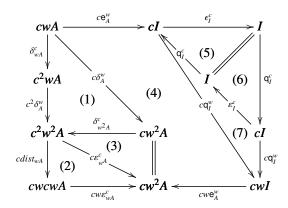

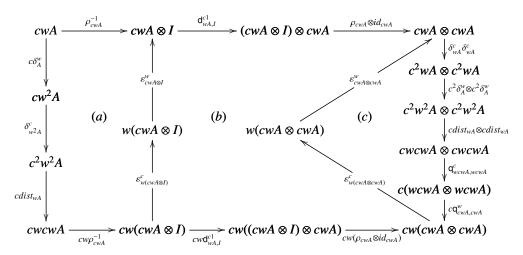

Diagram 2: Coalgebra Morphism 2

We show that Diagram 1 commutes by the diagram below. (1) commutes by the naturality of  $\delta^c$ . (2) commutes by the condition of  $dist_{wA}$ . (3), (5) and (6) commute because c is a monoidal comonad. (4) commutes because ( $\mathcal{L}$ , w,  $e^w$  is a linear category with weakening. (7) commutes by equality.

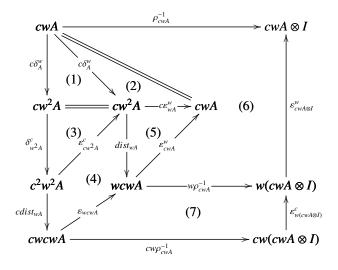

To prove Diagram 2 commutes, we first expand it, Then we divide it into three

parts and prove each part commutes, as shown below.

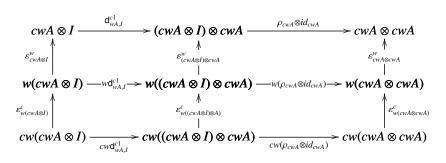

Part (a) commutes by the following diagram chase. (1) is equality. (2) is the comonad law for w. (3) is the comonad law for c. (4) commutes by the naturality of  $\varepsilon^c$ . (5) is one of the conditions for  $dist_{wA}$ . (6) commutes by the naturality of  $\varepsilon^w$ . And (7) commutes by the naturality of  $\varepsilon^c$ .

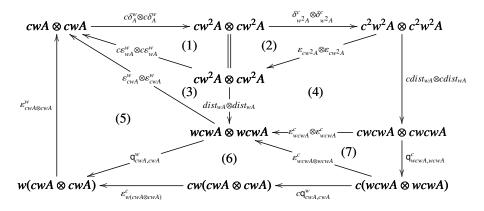

Part (b) commutes by the following diagram chase. The upper two squares both commute by the naturality of  $\varepsilon^w$ , and the lower two squares commute by the

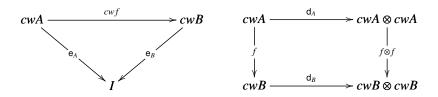

naturality of  $\varepsilon^c$ .

Part (c) commutes by the following diagram. (1) and (2) are the comonad law. (3) commutes by the condition of  $dist_{wA}$ . (4) and (6) commute by the naturality of  $\varepsilon^c$ . (5) and (7) commute because w and c are monoidal comonads.

• any coalgebra morphism  $f:(!A,\delta_A)\longrightarrow (!B,\delta_B)$  between (free?) coalgebras preserve the comonoid structure given by e and d, i.e. the following diagrams commute.
